## Linux Networking Commands

Every computer is connected to some other computer through a network whether internally or externally to exchange some information. This network can be small as some computers connected in your home or office, or can be large or complicated as in large University or the entire Internet.

Maintaining a system's network is a task of System/Network administrator. Their task includes network configuration and troubleshooting.

Here is a list of Networking and Troubleshooting commands:

<a href="#"><u>ifconfig</u></a>	Display and manipulate route and network interfaces.
<a href="#"><u>ip</u></a>	It is a replacement of ifconfig command.
<a href="#"><u>tracert</u></a>	Network troubleshooting utility.
<a href="#"><u>tracert</u></a>	Similar to tracert but doesn't require root privileges.
<a href="#"><u>ping</u></a>	To check connectivity between two nodes.
<a href="#"><u>netstat</u></a>	Display connection information.
<a href="#"><u>ss</u></a>	It is a replacement of netstat.

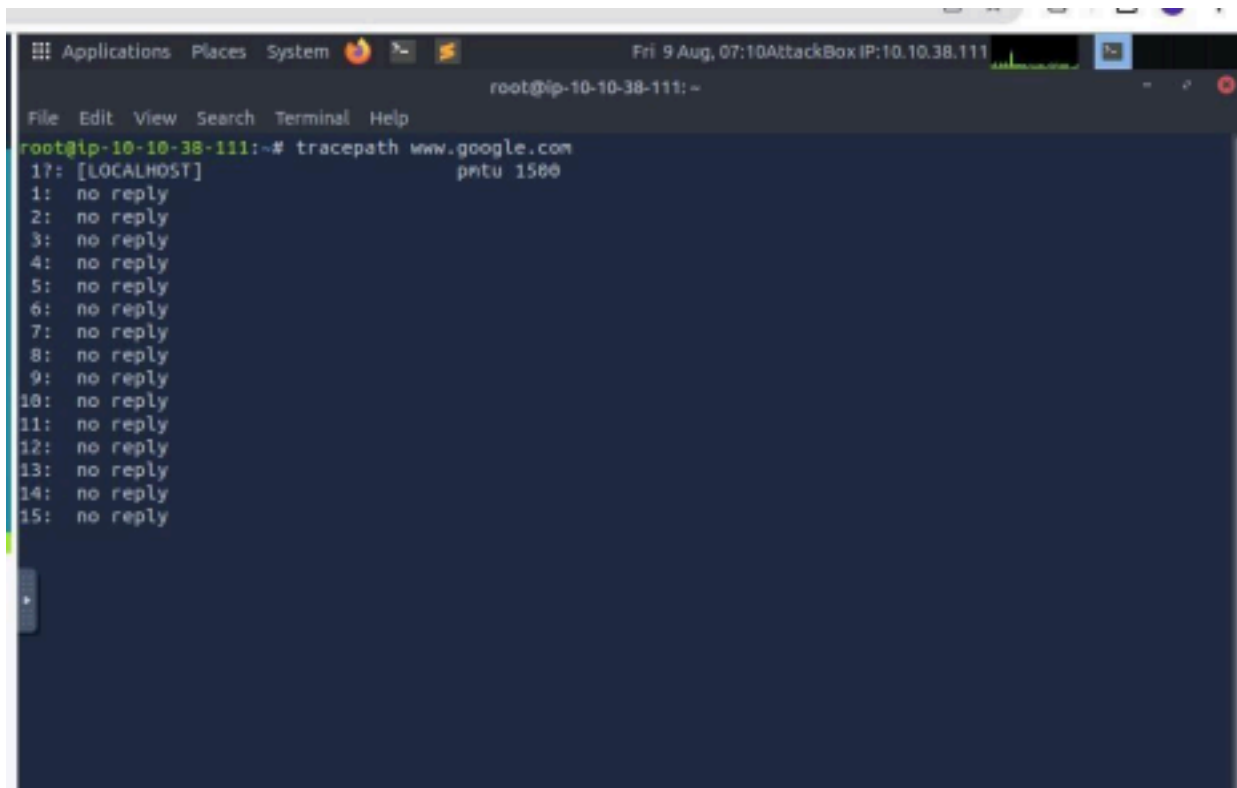

```

root@ip-10-10-38-111:~# tracert www.google.com
 17: [LOCALHOST]                                pntu 1500
 1: no reply
 2: no reply
 3: no reply
 4: no reply
 5: no reply
 6: no reply
 7: no reply
 8: no reply
 9: no reply
10: no reply
11: no reply
12: no reply
13: no reply
14: no reply
15: no reply

```

<a href="#"><u>dig</u></a>	Query DNS related information.
<a href="#"><u>nslookup</u></a>	Find DNS related query.
<a href="#"><u>route</u></a>	Shows and manipulate IP routing table.
<a href="#"><u>host</u></a>	Performs DNS lookups.
<a href="#"><u>arp</u></a>	View or add contents of the kernel's ARP table.
<a href="#"><u>iwconfig</u></a>	Used to configure wireless network interface.

<a href="#"><u>hostname</u></a>	To identify a network name.
<a href="#"><u>curl or wget</u></a>	To download a file from internet.
<a href="#"><u>mtr</u></a>	Combines ping and traceroute into a single command.
<a href="#"><u>whois</u></a>	Will tell you about the website's whois.
<a href="#"><u>ifplugstatus</u></a>	Tells whether a cable is plugged in or not.

A screenshot of a Linux terminal window. The window title bar shows 'Applications Places System' and a date/time 'Fri 9 Aug, 07:10' along with an IP address 'AttackBox IP:10.10.38.111'. The terminal prompt is 'root@ip-10-10-38-111:~'. The command 'tracert www.google.com' has been executed. The output shows a series of hops from the local host to the destination. The first hop is '[LOCALHOST]'. The subsequent hops (1 through 15) all show 'no reply', indicating a lack of response from those intermediate routers. The command 'ping 1500' is also visible in the output.

```
root@ip-10-10-38-111:~# tracert www.google.com
 1:  [LOCALHOST]                pmtu 1500
 1:  no reply
 2:  no reply
 3:  no reply
 4:  no reply
 5:  no reply
 6:  no reply
 7:  no reply
 8:  no reply
 9:  no reply
10:  no reply
11:  no reply
12:  no reply
13:  no reply
14:  no reply
15:  no reply
```

Explanation of the above commands:

**1.ifconfig:** ifconfig is short for interface configurator. This command is utilized in network inspection, initializing the interface, enabling or disabling an IP address, and configuring an interface with an IP address. Also, it is used to show the network and route interface.

The basic details shown with ifconfig are:

- MTU
- MAC address
- IP address

**Syntax:**

Ifconfig

```

root@ip-10-10-38-111:~# tracert www.google.com
17: [LOCALHOST]                                pmtu 1500

    TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0

```

**2. ip:** It is the updated and latest edition of ifconfig command. The command provides the information of every network, such as ifconfig. Also, it can be used to get information about a particular interface.

The image shows a terminal window with a dark blue background. At the top, there is a menu bar with 'Applications', 'Places', and 'System'. The title bar indicates the date and time as 'Fri 9 Aug, 07:10' and the IP address as 'AttackBox IP: 10.10.38.111'. The terminal prompt is 'root@ip-10-10-38-111: ~'. The command 'tracert www.google.com' has been executed. The output shows a series of hops from the local host to the destination, with most hops showing 'no reply' and a final hop showing 'pntu 1500'.

```
root@ip-10-10-38-111:~# tracert www.google.com
 1?: [LOCALHOST]           pntu 1500
 1:  no reply
 2:  no reply

**3.traceroute:** The traceroute command is one of the most helpful commands in the networking field. It's used to balance the network. It identifies the delay and decides the pathway to our target. Basically, it aids in the below ways:

- It determines the location of the network latency and informs it.
- It follows the path to the destination.
- It gives the names and recognizes all devices on the path.

### Syntax:

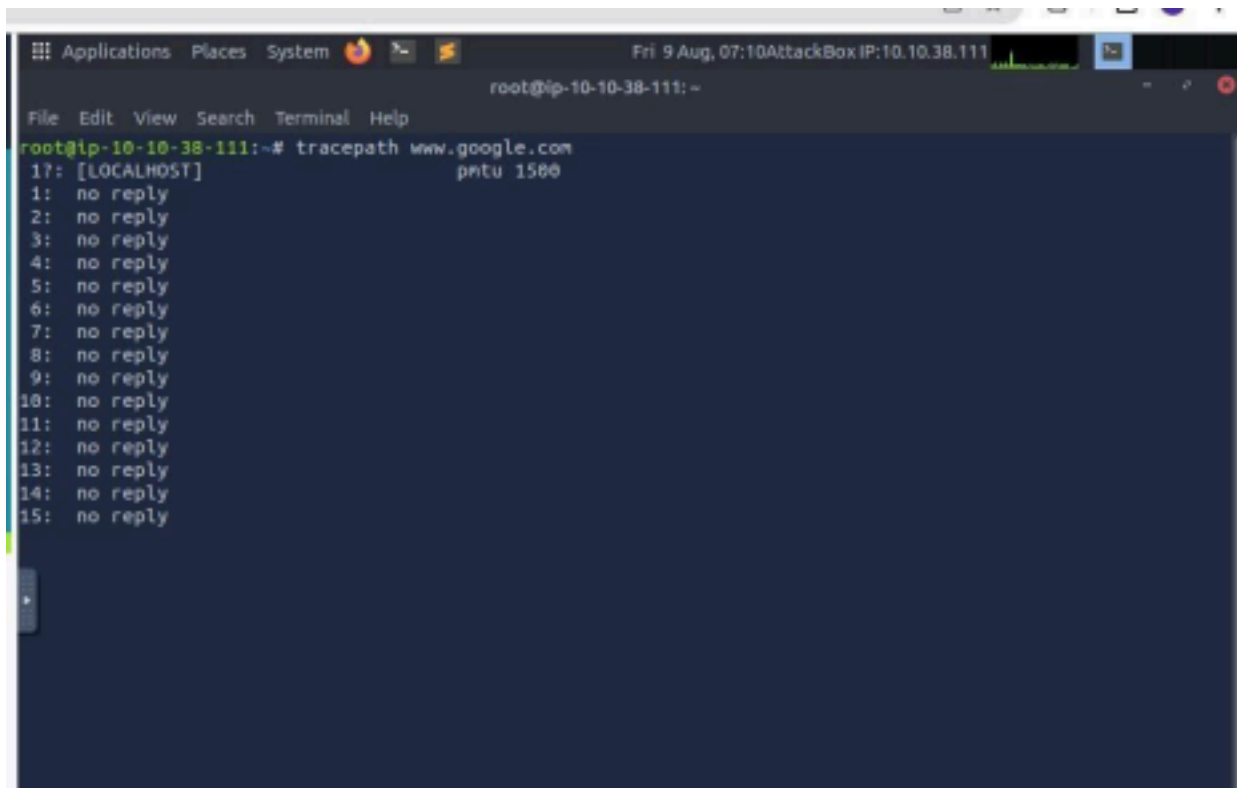

traceroute <destination>

```

root@ip-10-10-38-111:~# traceroute www.google.com
traceroute to www.google.com (209.85.202.104), 30 hops max, 60 byte packets

14: no reply
15: no reply
```

4. **tracert**: The tracert command is the same as the traceroute command, and it is used to find network delays. Besides, it does not need root privileges. By default, it comes pre-installed in Ubuntu. It traces the path to the destination and recognizes all hops in it. It identifies the point at which the network is weak if our network is not strong enough.

#### Syntax:

tracert <destination>

5. **ping**: It is short for Packet Internet Groper. The ping command is one of the widely used commands for network troubleshooting. Basically, it inspects the network connectivity between two different nodes.

#### Syntax:

ping <destination>

```

A screenshot of a Linux terminal window. The window title bar shows 'Applications Places System' and a clock 'Fri 9 Aug, 07:10'. The terminal prompt is 'root@ip-10-10-38-111:~'. The command 'tracert www.google.com' has been executed. The output shows a series of hops from the local host to the destination. The first hop is '[LOCALHOST]'. The subsequent hops are numbered 1 through 15, each followed by 'no reply'. The final line of output is '15: no reply'. The terminal window has a menu bar with 'File Edit View Search Terminal Help' and a status bar at the bottom showing 'root@ip-10-10-38-111:~'.

**netstat:** It is short for network statistics. It gives statistical figures of many interfaces, which contain open sockets, connection information, and routing tables.

### Syntax:

Netstat

```

```

A screenshot of a Linux terminal window. The window title bar shows 'Applications Places System' and a date/time 'Fri 9 Aug, 07:10' along with an IP address 'AttackBox IP:10.10.38.111'. The terminal prompt is 'root@ip-10-10-38-111: ~'. The command 'tracert www.google.com' has been executed. The output shows a single hop to the localhost, followed by 15 hops that all result in 'no reply'. The window has a menu bar with 'File Edit View Search Terminal Help' and a status bar at the bottom.

7. **ss:** This command is the substitution for the netstat command. The ss command is more informative and much faster than netstat. The ss command's faster response is possible because it fetches every information from inside the kernel userspace.

### **Syntax:**

Ss

**Syntax:**

nslookup <domainname>

9. **dig:** dig is short for Domain Information Groper. The dig command is an improvised edition of the nslookup command. It is utilized in DNS lookup to reserve the DNS name server. Also, it is used to balance DNS related problems. Mainly, it is used to authorize DNS mappings, host addresses, MX records, and every other DNS record for the best DNS topography understanding.

**Syntax:**

dig <domainname>

```

10. **route:** The route command shows and employs the routing table available for our system. Basically, a router is used to detect a better way to transfer the packets around a destination.

### Syntax:

Route

11. **host:** The host command shows the IP address for a hostname and the domain name for an IP address. Also, it is used to get DNS lookup for DNS related issues.

### Syntax:

host -t <resourceName>

12. **arp:** The arp command is short for Address Resolution Protocol. This command is used to see and include content in the ARP table of the kernel.

### Syntax:

1. Arp

13. **iwconfig:** It is a simple command which is used to see and set the system's hostname.

### Syntax:

Hostname

14. **curl and wget:** These commands are used to download files from CLI from the internet. curl must be specified with the "O" option to get the file, while wget is directly used.

### curl Syntax:

1. curl -O <fileLink>

15. **wget**

```

root@ip-10-10-38-111: ~# tracert www.google.com
 17: [LOCALHOST]                                pntu 1500

```

## Syntax

:

1. wget [<fileLink>](#)

16. **mtr**: The mtr command is a mix of the traceroute and ping commands. It regularly shows information related to the packets transferred using the ping time of all hops. Also, it is used to see network problems.

## Syntax:

1. mtr [<path>](#)

17. **whois**: The whois command fetches every website related information. We can get every information of a website, such as an owner and the registration information.

## Syntax:

1. mtr [<websiteName>](#)

18. **ifplugstatus**: The ifplugstatus command checks whether a cable is currently plugged into a network interface. It is not available in Ubuntu directly. We can install it with the help of the below command:

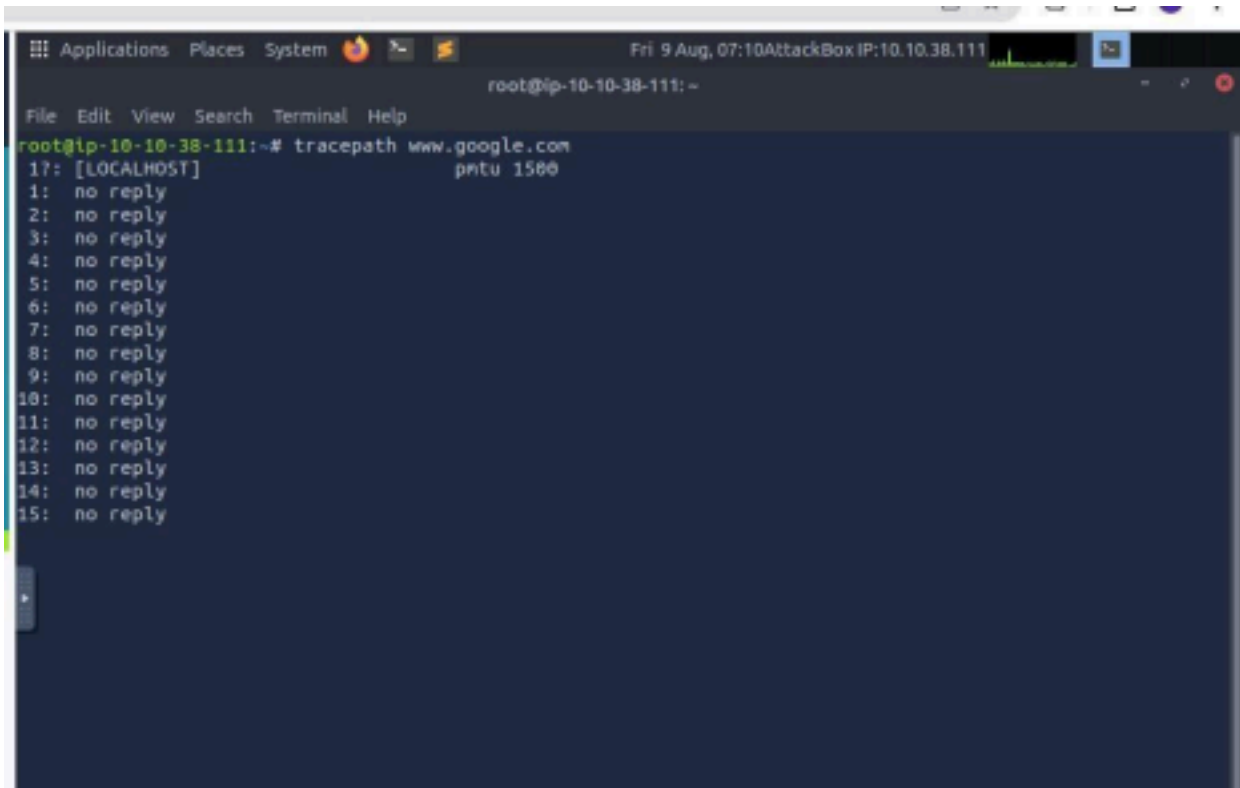

1. sudo apt-get install ifplugd

## Syntax:

1. Ifplugstatus

**iftop**: The iftop command is utilized in traffic monitoring.

**tcpdump**: The tcpdump command is widely used in network analysis with other commands of the Linux network. It analyses the traffic passing from the network

A screenshot of a Linux terminal window. The window title bar shows 'Applications Places System' and a date/time 'Fri 9 Aug, 07:10' along with 'AttackBox IP:10.10.38.111'. The terminal prompt is 'root@ip-10-10-38-111: ~'. The user has entered the command 'tracert www.google.com'. The output shows a series of hops from the local host to the destination, with most hops showing 'no reply' and a final hop showing '15: no reply'. The terminal has a dark blue background and a light blue border.

```
root@ip-10-10-38-111:~# tracert www.google.com
